1. Dockerize a Wordpress application. Write a docker-compose.yml file to deploy wordpress applications using docker.
   Download link for wordpress: https://wordpress.org/download/

2. Create an architecture design for streaming application whose code is given below. Make sure the application scales from 0 to 100 million requests.
   Link for the project: https://github.com/UnpredictablePrashant/StreamingApp

   Expected: Architecture Design, Dockerize the application, Deploy the application using EC2. MongoDB should be dockerized too.
